

Editor Scene Loader Guide

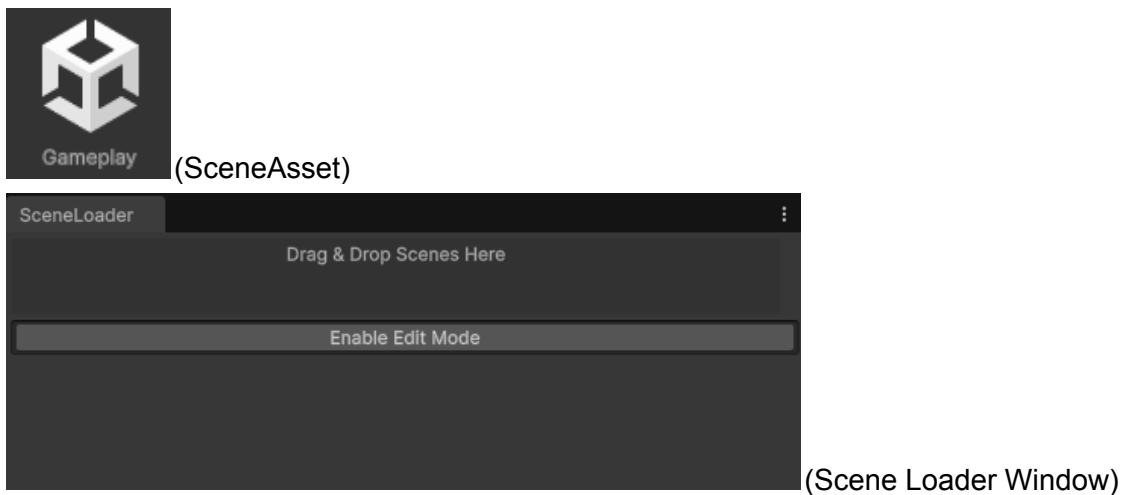

Setting Up

Opening Scene Loader Window

To open the Scene Loader Window, go to the Toolbar:
Tools > Lugu > Scene Loader

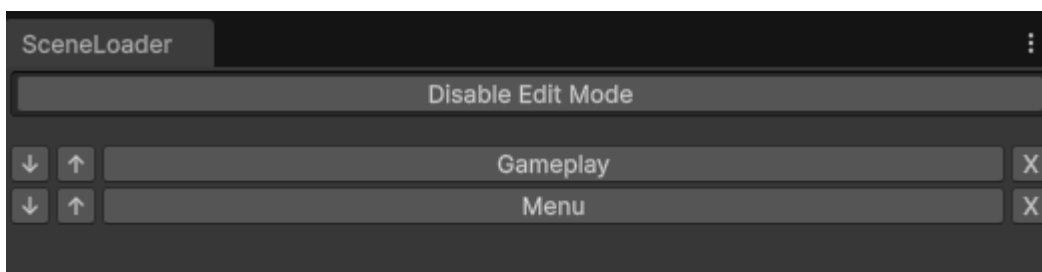

Adding Scenes

To add new Scenes to the scene, just Drag & Drop any Scene Assets at the Scene Loader Window.

Edit Mode

To toggle Edit Mode, press the button at the top of the Scene Loader Window.

While in Edit Mode you can do the following:

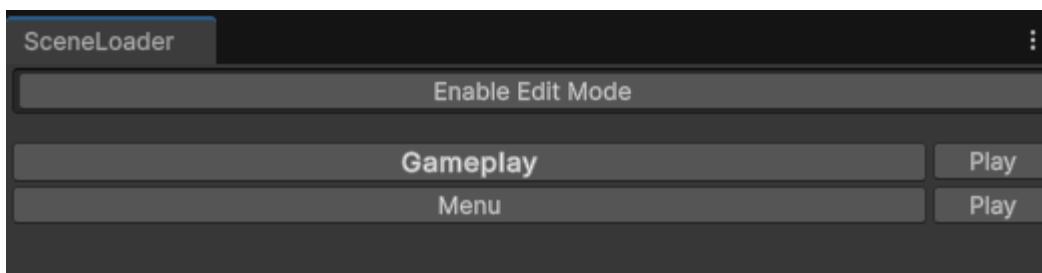

Removing Scenes

Remove scenes from the list by pressing the **X** button on the right of a listed scene.

Sorting Scenes

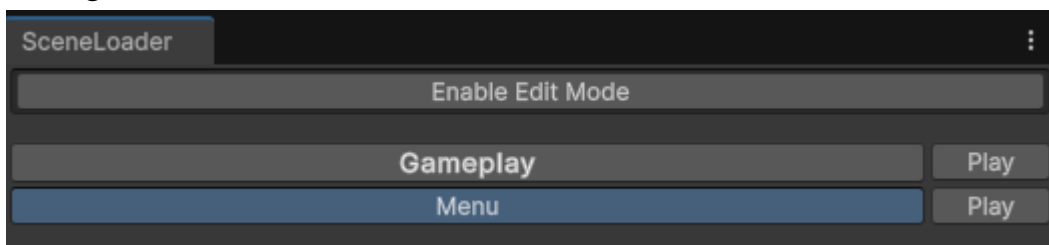

Change the position of a listed Scene by pressing the Arrow buttons on the left of the listed scene.

Features

Load Scenes (Editor & Playmode)

By pressing the **Scene Name** on the list the current active scene will change to that scene.

(To change a scene in Playmode the Scene must be in the Scene List of the Active Build Profile)

Play Scenes Remotely (Only in Editor)

By pressing the **Play** button on the right of a listed Scene, Unity will **enter Playmode** in that Scene, and when **exiting Playmode** it will return to the **previously active scene**.

Notes

- Editor Scene Loader **doesn't** currently support any additive scene loading.

- While using git, the loaded scenes from a user will be saved locally, so each member can have their own set of listed scenes that better suit their workflow.
- Join the discord for bug reports and discussions related to all Lugu's tools.
